一、使用范围及结构特点

GK2006型系列产品，是手提式电动工业封包机，系我厂已获国家专利，具有升级换代双线改单线只需更换勾针无须调整任何部件是现代手提缝纫机大力士最新产品。

本机采用先进的上下综合送料机构和自动剪线机构，能缝合厚薄不同的各种布袋、纸袋、塑料纺织袋、纸塑复合袋，麻袋等包装袋。所缝的线迹具有弹性，线迹美观，封包牢固、拆包方便的特点，是当今最佳的封包设备。

针距长度	6—8毫米
The needle is apart from the length	
最大缝料厚度	6毫米
biggest seam material thickness	
缝线规格	21支 2 X 3 涤纶线
Sewing yheadspe-cification	Polyester fiberline
机器净重	4kg
Machin e net weight	
电机	10000/分 90W
Electricalmachinery	

一、Use scope and structure speaial artillery

The GK 2006 series product is the portable-type electrically operated, industry sewing machine, was my factory has attained the country specially to blow. Has turns to a new generation the double thread to change the single track only to have to replace cancels the needle not to need to adjust any part

This machine uses advanced about to synthesize the feed mechanism box to move with automatically reduces the line organization. Can suture the thickness different each kind of cloth sack the paper bag the plastic spinning and weaving bag the paper modles compound packing and so on bag gunnysack. Sews the line mark has elastic the line artistic seam pzckage relcable opens a package of convenient characteristic is now a best seam package of equipment.

二、设备启动前的准备

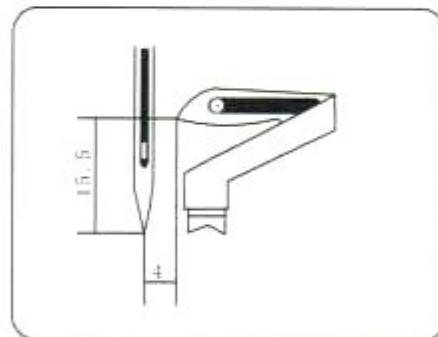

1. 润滑是保持机械设备处于良好状态必不可少的条件，应将润滑油倒入油壶（容量为45cc）。在启动设备之前应连续将润滑油装置加油按钮10次，即可使润滑油流向机械设备。应如满足够的润滑油，以确保在正常操作条件下能够维持平均4小时的设备运转。不得在未加注润滑油的情况下运行设备，这样会导致设备故障或损坏。
2. 缝针的调整，转动皮带轮使行针杠杆到最高位置时，松开针固定螺丝看是否与柄部的扁对正，调整后拧紧针固定螺丝。
3. 穿线，缝口机在供货时已穿好线，以向你展示机器的正确穿线方式。如图2所示，以便于识别，应遵照图中的次序穿线。

三、设备调整

重要提示：

在进行设备调整或更换零件时，必须将电源插头从供电电源上拔下，这对于保证操作人员和调整维修工的人身安全是非常重要的。

1. 穿线张紧度通过调整穿线张紧螺母即可调节穿线张紧度。顺时针方向转动张紧螺母，可夹紧穿线，逆时针方向转动张紧螺母，可使穿线放松。
2. 缝针和打环机构位置打环机构在通过缝针背面凹形处两针相交时不得相碰，其间隙为0.005-0.15mm。调节时拧开导架紧固螺丝，当直针下达最低点，距下轴中心约5mm处时，直针针尖处到弯针针尖处约15.5mm，从直针中心到弯针尖处约4mm处为最佳工作状态。这时拧紧导架紧固螺丝。

图形1

3、护针板调节

为了避免机针下刺时发生弯曲，护针板可起到保护作用。两者的间隙为0.08-0.13mm。调整时将小手轮往工作方向转动，使护针板靠近机针，松开机牙紧固螺丝，移动护针板至合理间隙后再拧紧机牙紧固螺丝。这样不会影响机牙，因为送料牙处有送料牙调整螺丝，所以不会影响送料牙的高度。

4、送料牙调节

根据缝料质量，厚度确定送料牙的高度，对封布袋、塑料编织袋等，一般高出针板上平面平均1.2-1.8mm，调整时先拧开机牙固定螺丝，调节送料牙调节螺丝，调整后拧紧送布牙紧固螺丝。

5、针距长度调节

针距长短的调节，是通过针距调节螺丝来定，需调整时，先打开侧盖板，再松开针距调节螺母，然后调节针距调节螺丝，顺时针时针距小，逆时针时针距大，调整后，拧紧针距调节螺母。

6、压脚压力调节

压脚压力的大小，取决于送料的厚度，缝薄时需减少压力，反之，则增大压力。当缝料推送顺畅，针迹均匀时切勿再增大压力，以缓减机件的磨损。调节压力时可松开调压螺母，顺时针时压力大，逆时针时压力小，调整后，拧紧螺母即可。

二、The equipment starts before the equipment

1. The lubrication is maintained by the mechanical device to beat the good conditions until condition. Should pour into the oil pot the lubricating oil (capacity is 45cc). In front of starting outfit should continuously refuel the lubricating oil installment button 10. Then uses the lubricating oil to flow to the machinery to suppose yang. Should add completely the enough lubrication. Guarantees under the normal operation condition can the uygur impartial hour equipment transport the wheel. Must not move in the replenishment lubricating oil situation supposes yang. This can cause the equipment failure or the damage.
2. The stitching adjustment rotates the belt pulley to cause moving needle the release lever to the highest position time. The pine operates the needle anchor or screw to look whether with handle department flatly. After the adjustment screws tight the needle anchor screen.
3. Threading sews the mouth machine when supplying goods has put on the line. By approaching you to demonstrate the machine the correct threading way. Like chart 2 shows in order to the recognition should obey in the chart the order to thread

三、Equipment adjustment

Important prompt:

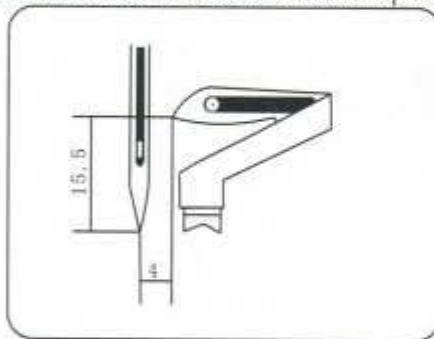

Is carrying on the equipment adjustment or the replacement components. Must pull out the power source plug from the electric power supply. This and adjusts maintenance worker's personal safety regarding the guarantee operator is count for much.

1. Threads anxiety then to adjust threading through the adjustment threading clamps, nut clamps. Clockwise rotates clamps the nut may clamp puts on. The counter clockwise rotation clamps, nut may cause threading to put to.

2. The stitching and hits the link organization position to hit the link organization in the concave shape place two needles to intersect through the stitching back time does not have to be wrong. Intervene its twist convince for 0.005–0.15mm by patient analysis is shelf fasten screw act as. Is apart from time the lower, shelf center approximately 5mm place straight needle needle tip place to be in direct status to cancel the needle the needle-top 15.5mm. from straight needle center to curved needle tip place line mm place for best workshape.

3. Protects the needle board to move for under avoiding machine needle time line occur curve board the allowed to get up the protection to do.

When adjustment the small hand wheel toward the work directional rotation, causes to protect the needle board nearness machine needle, the pine starting tooth tight screw. The migration protects the needle board to serene tight machine the tooth tight screw again after the reasonable gap. Like this can not affect machine the tooth because the feeding tooth place has the feeding tooth adjusting screw therefore cannot affect the feeding tooth the altitude.

图形 1

4. Feeding tooth adjustment

According to seam material quality thickness determination feeding tooth altitude. To seal the cloth sack the plastic knitting bag and so on. Generally removes the acupuncture needle high panel plane average 1.2–1.8mm. When adjustment twists the starting tooth anchor screw first. Adjustment feeding tooth, adjusting screw. After the adjustment screws tight delivers the cloth tooth tight screw.

5. The needle is apart from the length adjustment.

The needle is apart from the length the adjustment is apart from the adjusting screw through the needle to decide. When must adjust turns on the side lap first then loosens the needle to be apart from the regulating nut. Then adjusts the needle to be apart from the adjusting screw. The clockwise hand of a clock is apart from slightly. The anticlockwise hand of a clock is apart from a big way. After the adjustment screws tight the needle to be apart from the regulating nut.

6. Presses the foot pressure control.

Presses the foot pressure the size is decided in feeding thickness. Seam thin when must reduce the pressure otherwise increases the pressure. When the seam cotton material push is smooth. Needle mark even when is sure not to increase the pressure again lightens and reduces the part the attrition. When adjustment pressure may loosen the accent to press the nut. The clockwise time pressure is small anti-clockwise time pressure high. After the adjustment twists off the nut the.

四、机器故障原因及解决方法

故障内容	原因	解决方法
断线	1. 线路穿错 2. 线源轧住 3. 缝线张力太紧，出线量不足 4. 缝线粗细不匀，拉力强度不够 5. 机针孔、针板孔或弯针孔有毛刺 6. 机针与弯针运动位置配合不好 7. 机针与或弯针相碰 8. 送料牙齿尖太锐 9. 压脚压力过大	正确穿线 检查排除 放松夹线板压力 选择质量合格的缝线 用细砂布光或调换 重新调整 重新调整间隙 磨钝齿尖 放松压脚压力
跳针	1. 机针凹型面装反或装斜 2. 机针与弯针运动不协调 3. 机针太高使弯针钩不到线或机针弯曲 4. 弯针挑线位置过低，过早释放底线 5. 机针细，而缝线粗，配合不当	调整机线方向 重新调整 调整机针高度或换新针 调高位置，延底线释放 调换机线或缝线
断机针	1. 机针弯曲 2. 机针与护针板或弯针相碰 3. 输送机速度快于缝纫速度 4. 细针缝厚料	换针 调整相互间隙 调整输送速度或缝纫速度 换粗针
机针线紧松不匀	1. 机针线线量不足或过多 2. 机针线夹线板压力过大或过小	调节线量调节杆高度 调整夹线板压力
送料呆滞	1. 送料牙齿面过低或齿面磨损 2. 压脚压力过小 3. 送料齿轮紧定螺钉松动	抬高齿面或调换送料牙 增加压脚压力 拧紧螺钉
上下层缝料不齐	1. 压脚压力太小 2. 压脚底面不光滑，阻力过大	调节调压螺套，增加压脚压力 抛光压脚底面
运动沉重	1. 机器装配不良 2. 传动皮带过紧 3. 运动部位缺油	检查装配间隙，进行调整 适当放松皮带 清除污物后注入润滑油
噪声大	1. 传动零件磨损使间隙增大 2. 紧定螺钉松动使零件之间发生碰撞 3. 油路不畅缺油	调换新零件 拧紧各部位螺钉 清除油路内尘埃，注入清洁润滑油

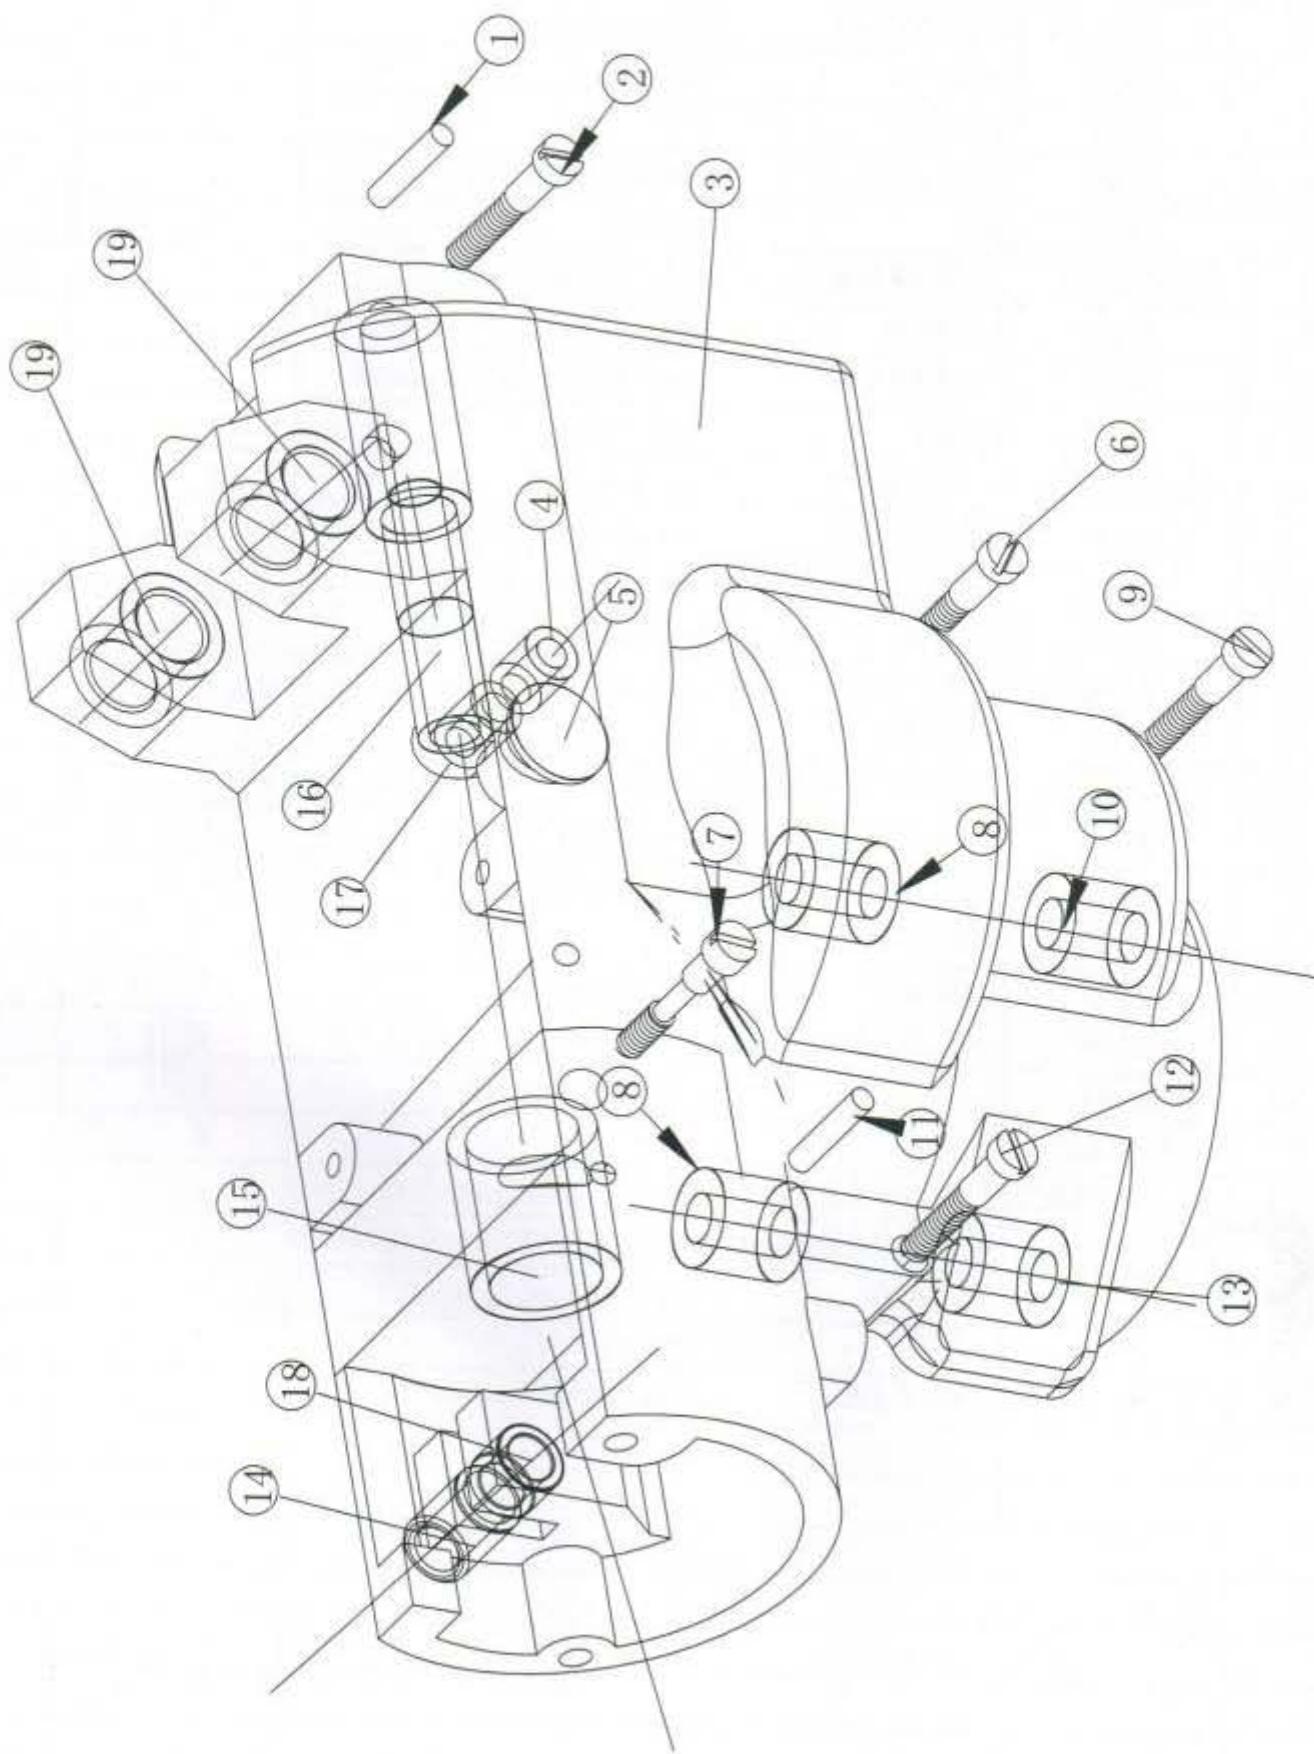

Mechanical breakdown reason and solution

Breakdowntent	Reason	Solution
Broken line	1.The line puts on wrong 2.The line source vo llover 3.The sewing thread ten sity too is tight the going beyond a line quantity is insufficient 4.The seam size of twine is not uniform the tensile strength is insufficient 5.machine pinhole needle board kong huo gou the pinhole has the hurr 6.machine the needle with cantels the needle traweling positon coordination hotto be good 7.Machine the needle with cantels the needle to bump 8.The feeding tooth too is incisive 9.Presses the foot pressure oversized	1.connect threading 2.Inspectioow elimination 3.The re laxat ion presses the forming blekp pressure 4.Choice quality appropriate sewing thread 5.Orexchanges with the crocus cloth polishing 6.Read justing 7.Read justs the gap 8.Rubs the obtuse crown 9.The relexationpresses the foot pressure
Bouncing pin	1.Machine the needle concwe shape swrface attire counter or installs slanting 2.Machirfe the needle with caneels the needle gearing not to be uncoordinated 3.Machine needle too high causing hook needle Does not hook the line or machine the needle iscwuing 4.The hook needle selects the lire position to be lower then the premature disconnection to put the ag 5.But machine the needle thin the sewing thread coordinates thickly impro	1.Adjust tement equipment andlines dir est ion 2.Read justing 3.The adjuster needlehighly or exchanges theneedle 4.Aoyu the high positiomextension a gent release 5.Exchanges the eqipment andlines o r the sewing thread
breaks a loom thread the needle	1.Machine the needle is curving 2.Machine the needle with protects the needle board the hook needle bu 3.conueyer speed quickly intai loring speed 4.pintle seam thick material	1.Trades the needle 2.Adjustment mutual gap 3.Adjust ment transfer rate ortailoring sp eed 4.Trades the basting
Machine the needle work loose and tight is not uniform	1.Machine needle work line quantity inswofficiency orecessively many 2.Machine needle work clamp pressure oversi zed orecessively small	1.Adjusts the pitch line quantity standard lever altitude 2.Adjustment clamp pressure
Feeding delay	1.Feeding tooth surface low or tooth faceattrition 2.Presses the foot pres sure excessivelyto be small 3.The feeding gear clamping screwhailbeeomes less crowded	1.Raises the tooth fale orexchanges the feeding tooth 2.Increases the compres sion footpress ure 3.Screws tight the bolt
On the lower level seammateial is un even	1.Presses the foot pressure too to be small 2.Not only presses the sole sur face oversi zed the slip resi stance	1.The adjustment accent presses the nut to l increase the compre ssionfoot press 2.Throws the light pressuresole surface
The movement isheavy	1.The machine equi prnent is not good 2.The trans mtssion be ltexcessively is tight 3.The move ment spot is out of gas	1.The inspectien assemblygap carries o n the adjustment 2.Relaxes the leather bett suitably 3.After the eliminationcontamination pa ors into thelubricating oil
The noise is big	1.The transmission components attritioncans es thegap incr ease 2.Theclanying screw nail couses between the components to hare the collisun loosel 3.The oil duct is out of gas impeded	Exchanges the new components Screws tight uarious spots balt In the elimina tion oil duct the dust purs in to the clean lubri cating oil
